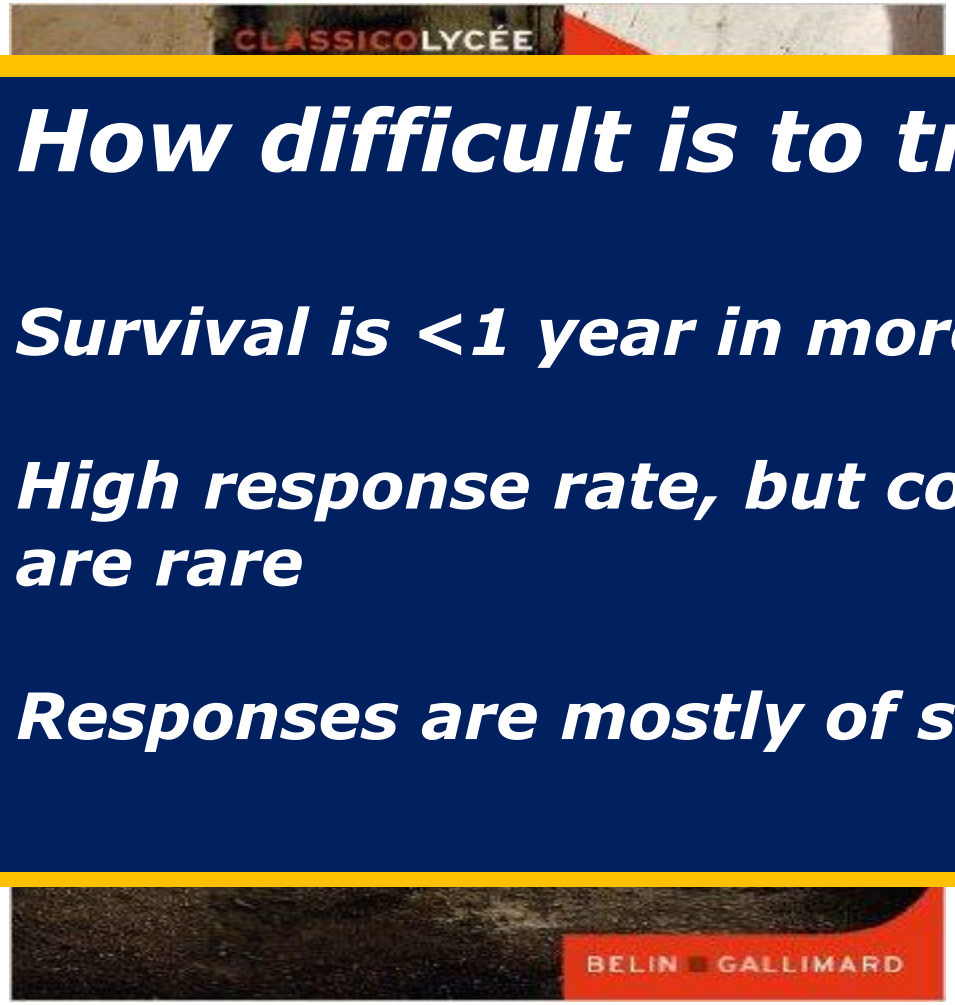
Treatment of metastatic gastric cancer
The challenge



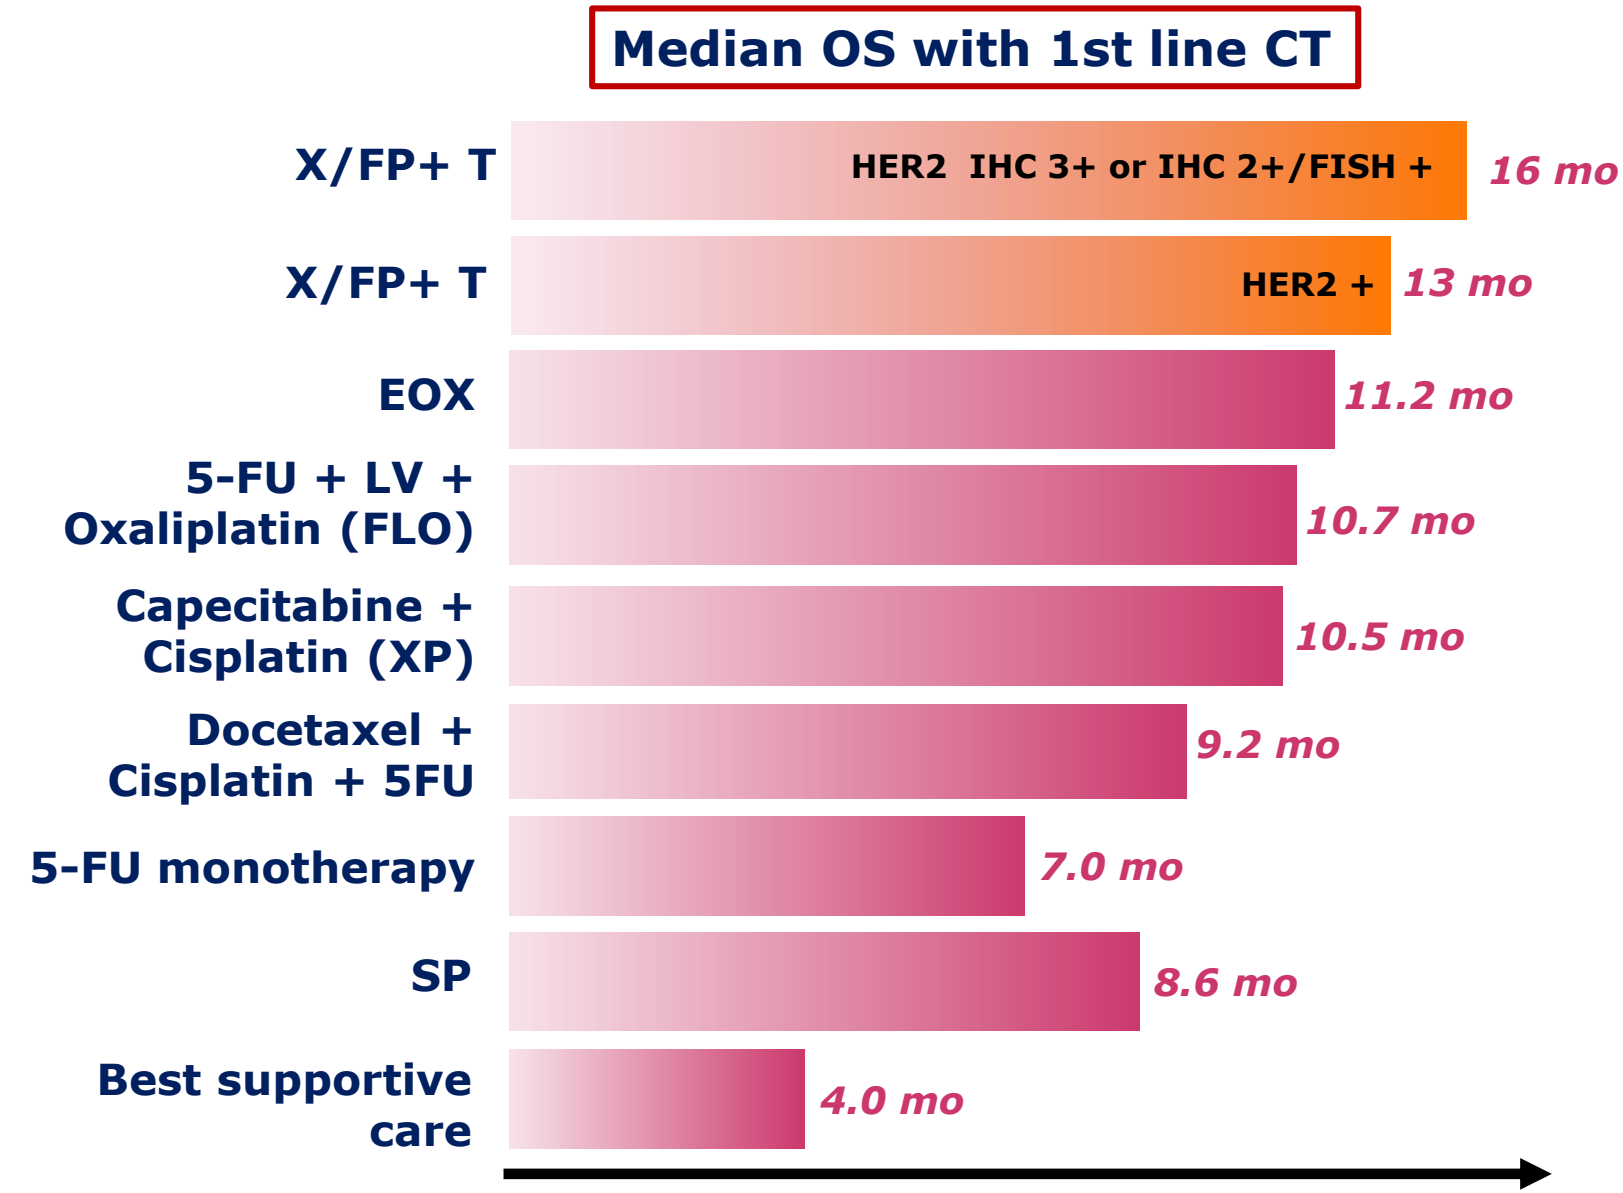
How difficult is to treat metastatic GC?

Survival is <1 year in more than half of patients

High response rate, but complete responses to CT are rare

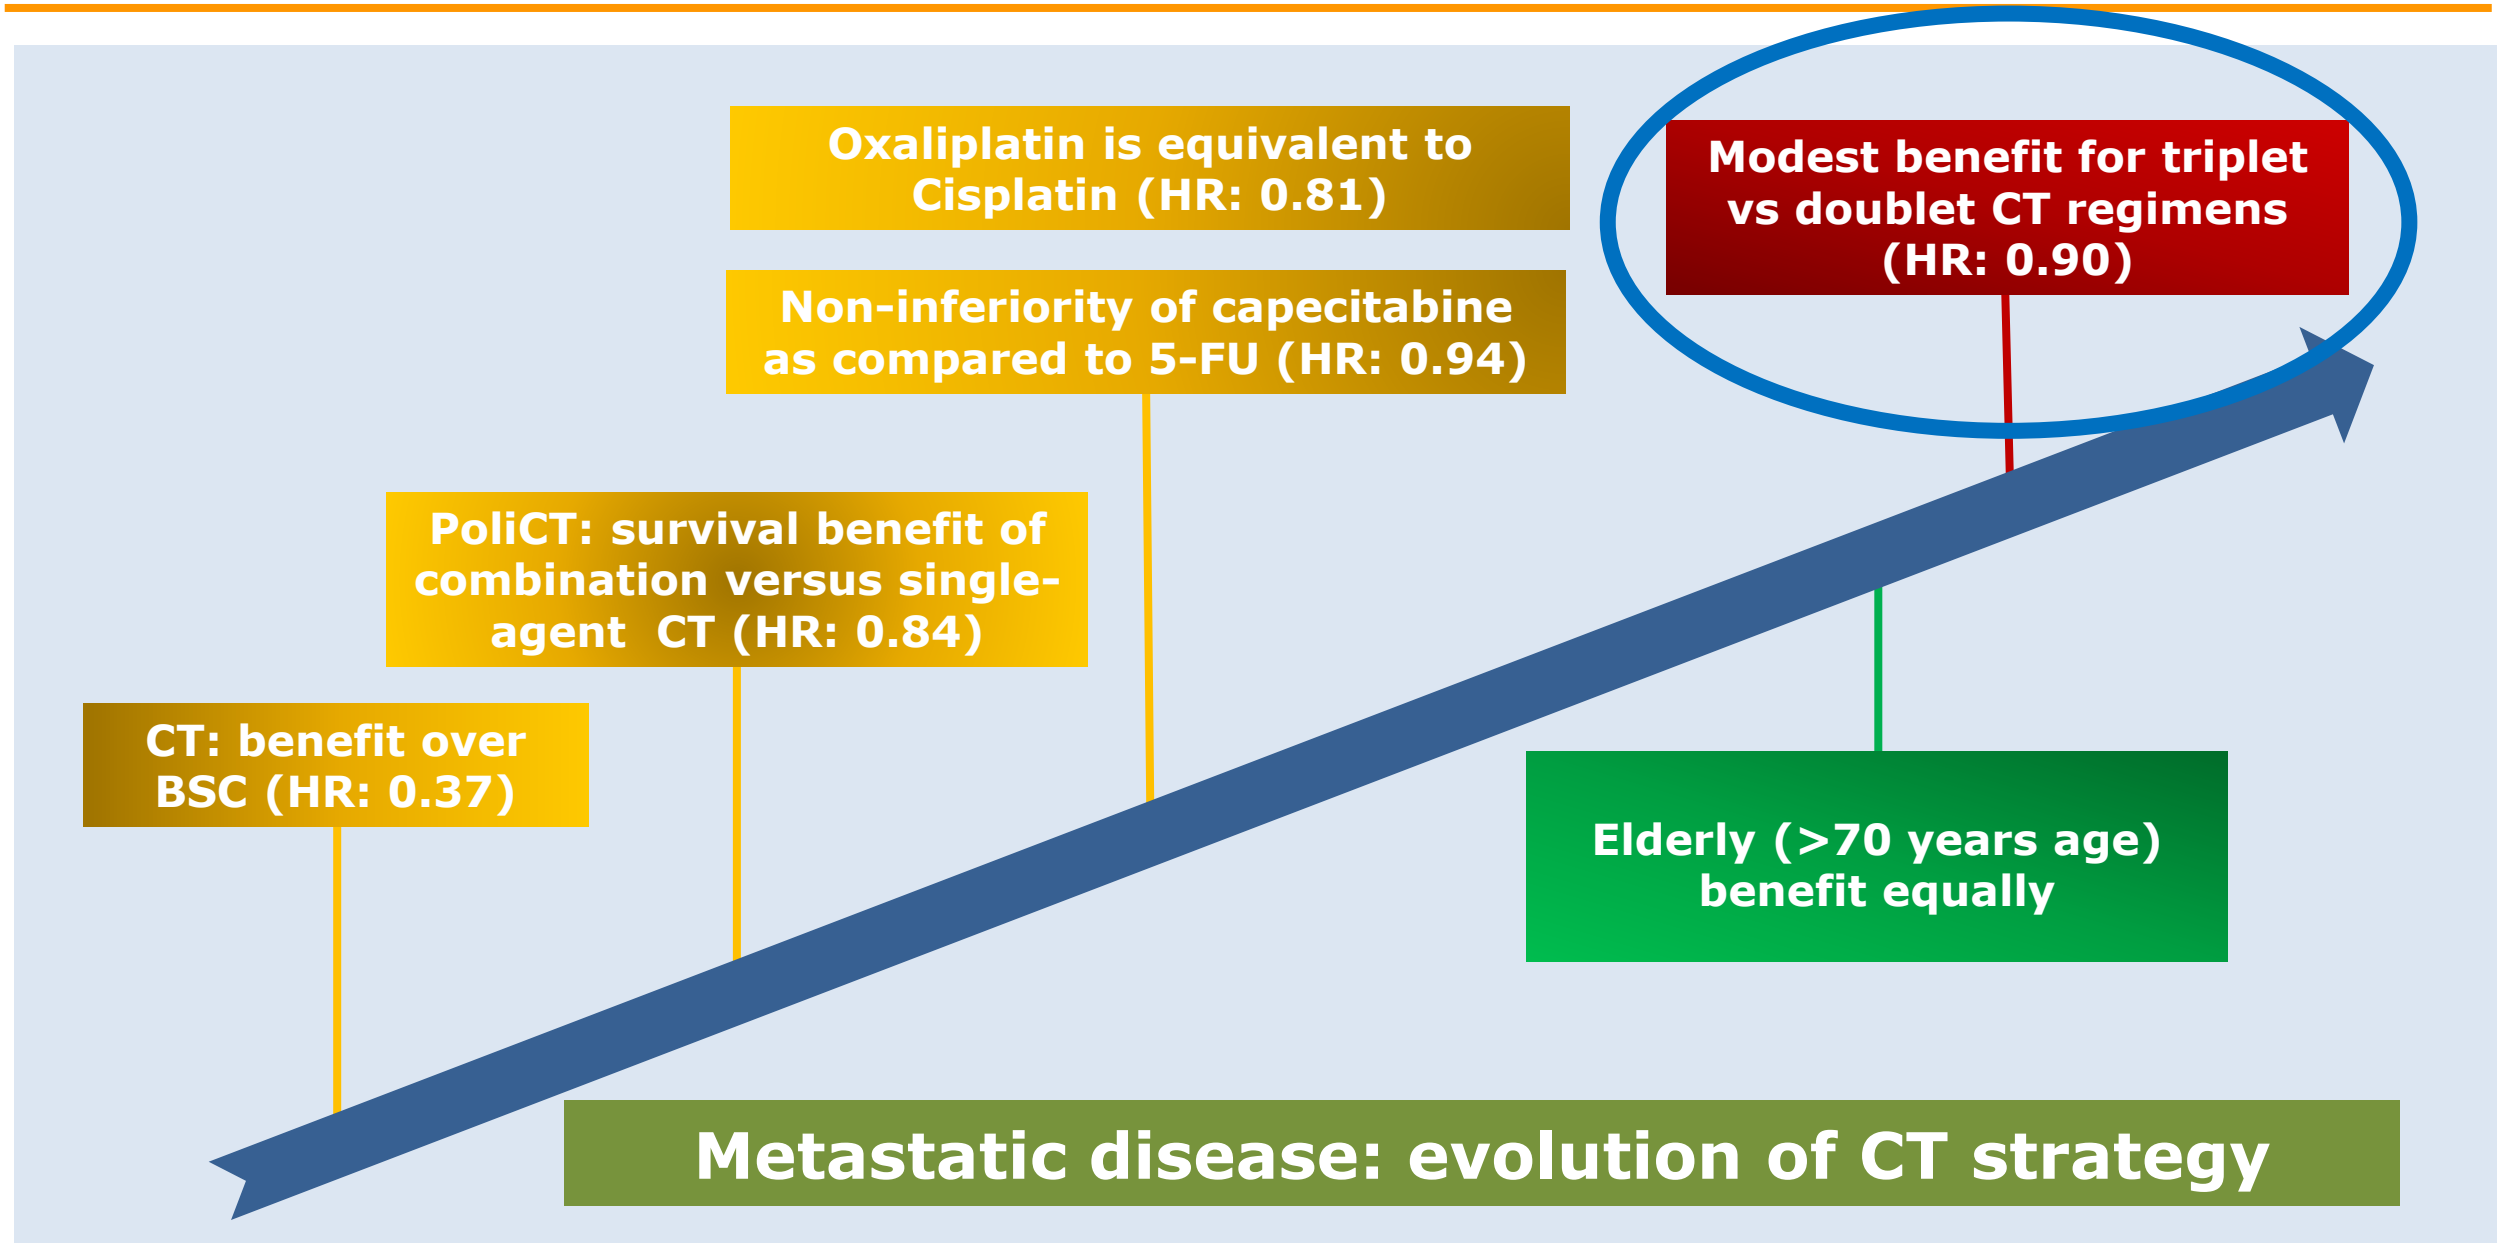
Responses are mostly of short duration

In mGC setting CT is the backbone of treatment but…
…limited progress with chemotherapy alone



CT plateau!

Metastatic setting treatment
What we know from clinical research…



Is the more the better?
Triplet or Doublet CT in Advanced Gastric Cancer?

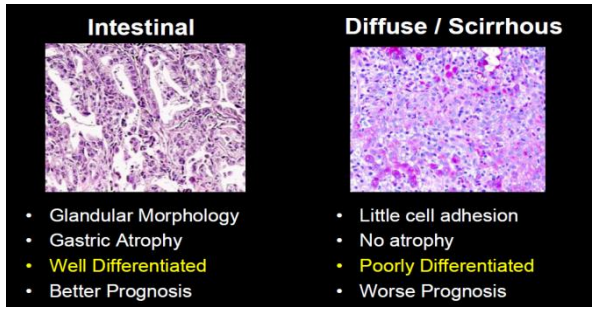
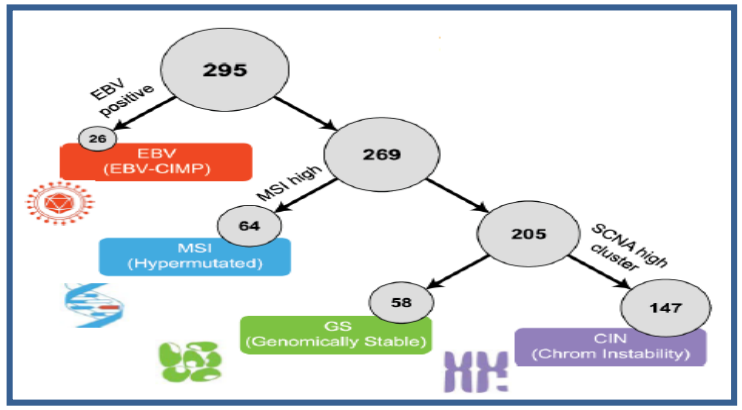
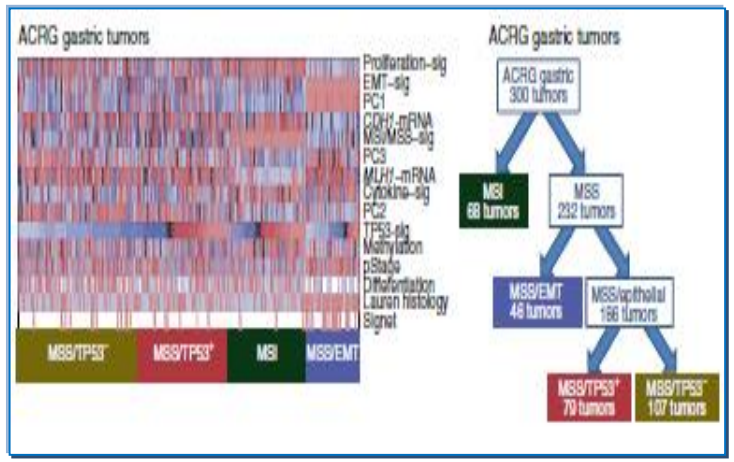
Why so disappointing results?
Genomic heterogeneity as a potential barrier to precision medicine







Evidence of GC heterogeneity
From histological to molecular classifications of GC

a TCGA

Subtype	EBV⁺ (9%)	MSI-high (22%)	Genomically stable (20%)	CIN (50%)
Molecular alterations	• *PIK3CA* mutations • *CDKN2A* silencing • *JAK2* amplification • PDL1 and PDL2 amplification	• *MLH1* silencing • Hypermutation of targetable oncoproteins	• *RHOA* mutations • *CDH1* mutations • Most diffuse type	• RTK amplification and overexpression • *TP53* mutations • Aneuploidy

b ACRG

Subtype	MSS/*TP53*⁺ (26%)	MSI-high (23%)	MSS/EMT (15%)	MSS/*TP53*⁻ (36%)
Molecular alterations	• Frequent mutations in *APC*, *ARID1A*, *PI3KCA* and *SMAD4* • Intact *TP53*	• Hypermutation • Frequent mutations in *KRAS*, *PI3K*, *PTEN*, *MTOR*, *ALK* and *ARID1A*	• Low mutational load • Loss of *CDH1* • Most diffuse type	• *TP53* mutation • RTK amplification • Overexpression of *HER2*, *EGFR*, *CCNE1*, *CCND1*, *GATA6* and *MYC*
Clinical phenotypes	• EBV⁺ • Intermediate-risk prognosis • Intermediate risk of recurrence	• Best prognosis • Low risk of recurrence • Commonly diagnosed at early stage	• Worst prognosis • High risk of recurrence • Late stage III–IV	• Intermediate-risk prognosis • Intermediate risk of recurrence

EGFR Amplification as a Target in Gastroesophageal Adenocarcinoma: Do Anti-EGFR Therapies Deserve a Second Chance?

John H. Strickler

Summary: Anti-EGFR therapies have failed to improve survival for unselected patients with metastatic gastroesophageal cancer, but in a subset of patients, *EGFR* amplification may predict treatment benefit. Maron and colleagues report the clinical activity of anti-EGFR therapies in a cohort of patients with *EGFR*-amplified metastatic gastroesophageal cancer and utilize serial blood and tumor tissue collection to identify molecular drivers of treatment sensitivity and resistance. Their insights offer a path to overcome technical limitations associated with *EGFR* amplification and facilitate molecularly targeted therapeutic strategies. *Cancer Discov; 8(6); 679–81. ©2018 AACR.*

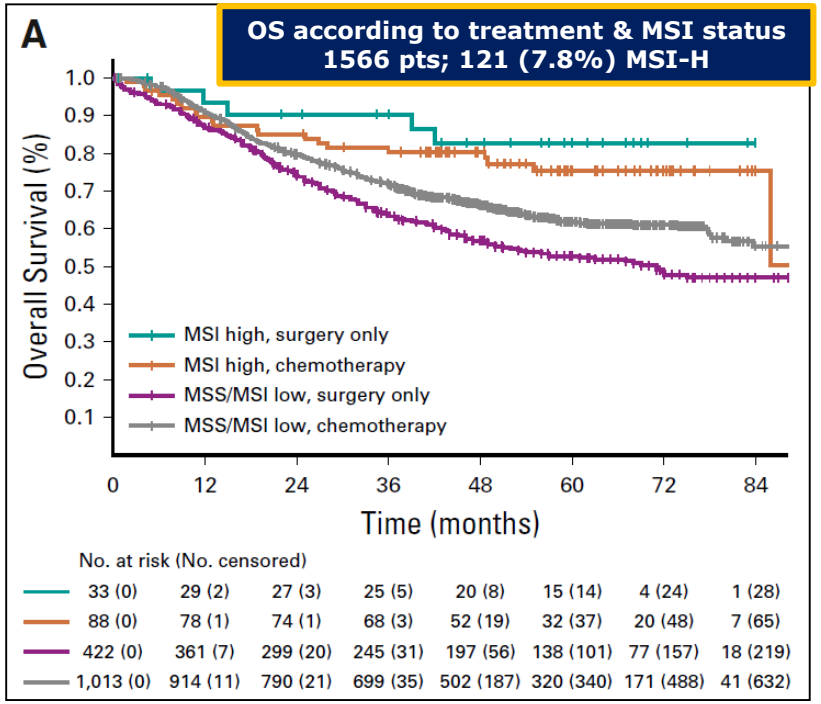
Shitara K, et al. ESMO 2019

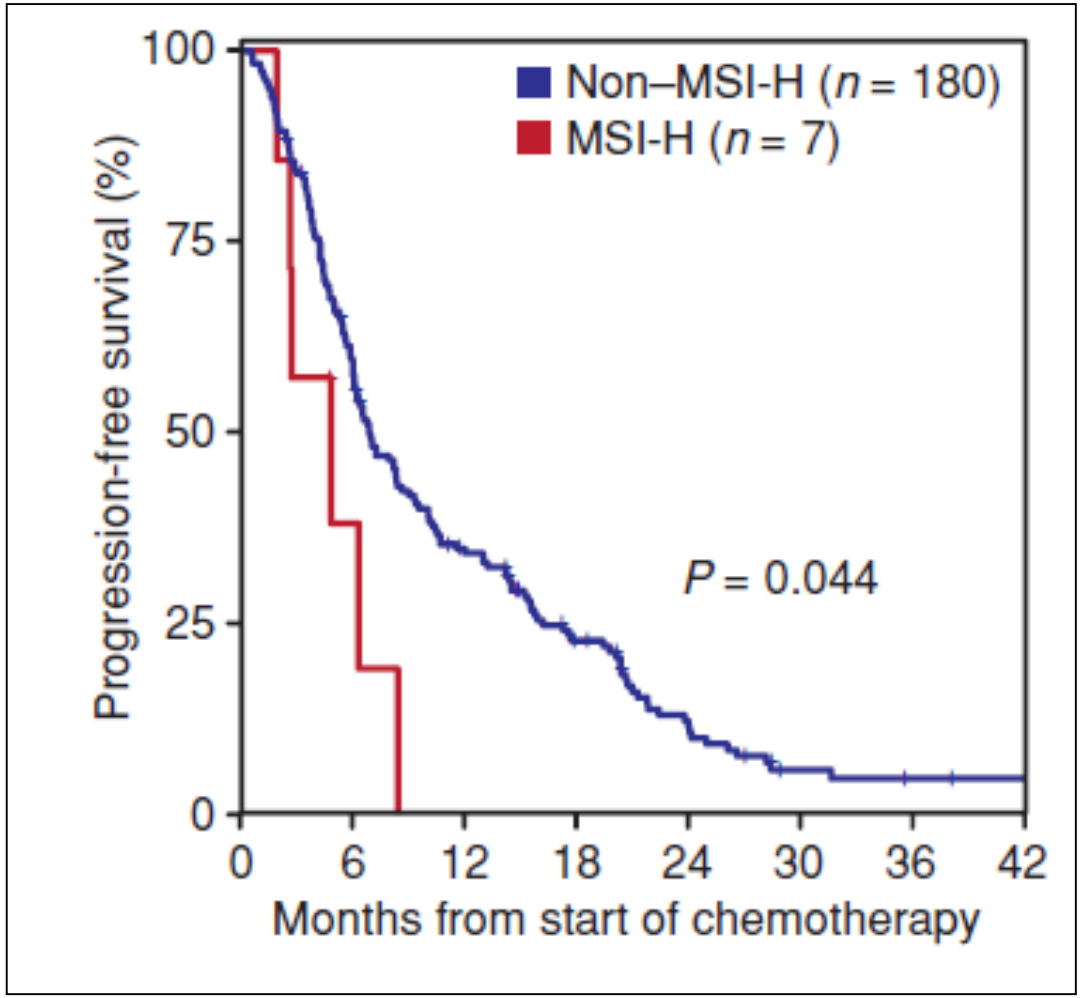
How to select pts for later line treatments?
Biological features: for MSI-H tumors CT may not be effective

OS according to treatment & MSI status
1566 pts; 121 (7.8%) MSI-H



Treatment Comparison by MSI Status and Survival Type	MAGIC + CLASSIC + ITACA-S + ARTIST No. of Events	5-Year Survival, % (95% CI)	HR (95% CI)	P*
OS				
MSS/MSI low: CT + surgery *v* surgery only	368 *v* 198	62.0 (58.9 to 65.3) *v* 52.8 (48.0 to 58.0)	0.75 (0.60 to 0.94)	.180
MSI high: CT + surgery *v* surgery only	21 *v* 5	75.4 (66.4 to 85.6) *v* 82.8 (70.1 to 97.8)	1.50 (0.55 to 4.12)	

PFS on first-line platinum-based therapy for pts with MSI-H vs. non–MSI-H tumors



Pietrantonio F, JCO 2019; Janjigian YY, Cancer Discovery 2018

Gastric cancer immune environment

EBV
- EBV-CIMP
- *PIK3CA* mutation
- *PD-L1/2* overexpression

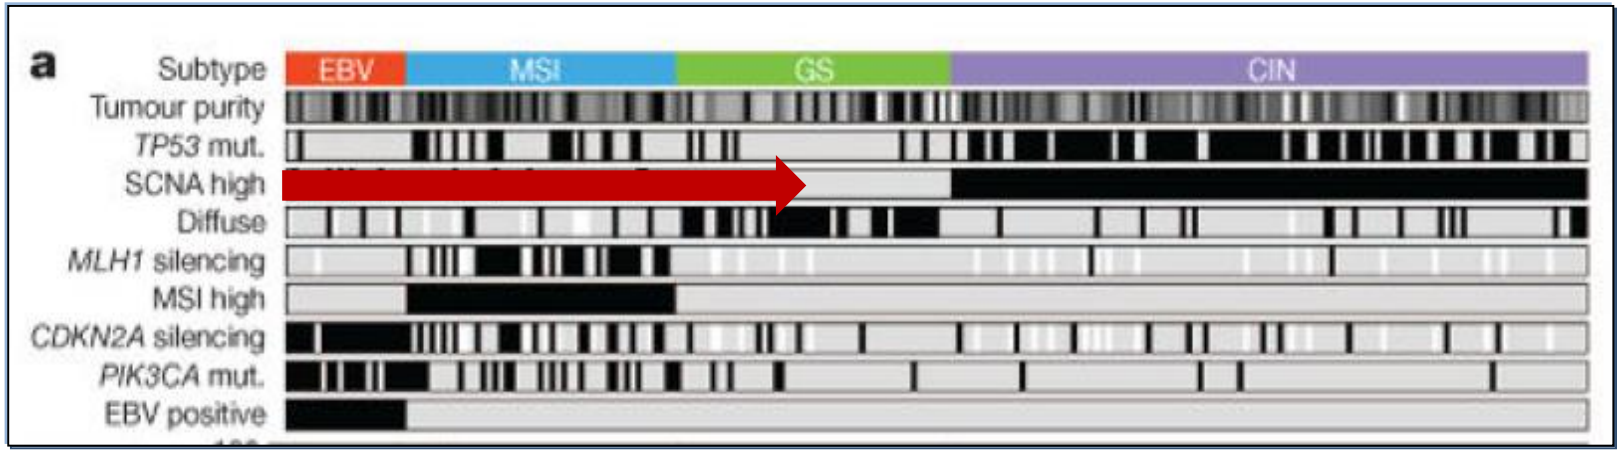
Rare in metastatic patients
PD-L1:
tumour ++ TILs +++
High IFNγ signature

MSI
- Hypermutation
- Gastric-CIMP
- *MLH1* silencing

Rare in metastatic patients
PD-L1:
tumour ++ TILs ++
High IFNγ signature

CIN
- *ERBB2* amplification
- *VEGFA* amplification
- *TP53* mutation

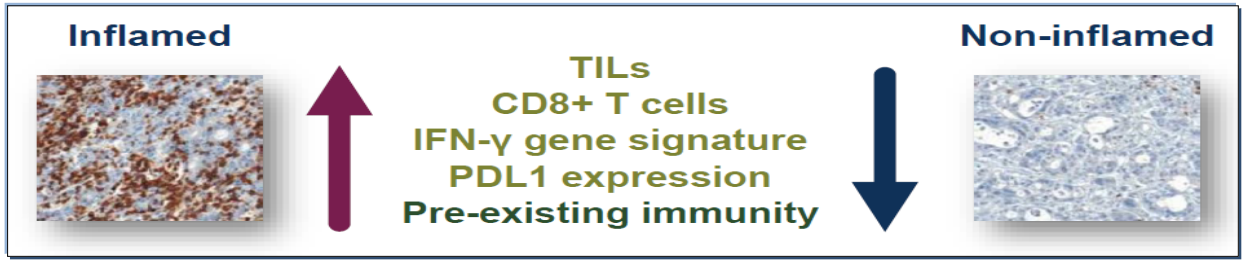
Copy number changes:
Low immune score
Low IFNγ signature



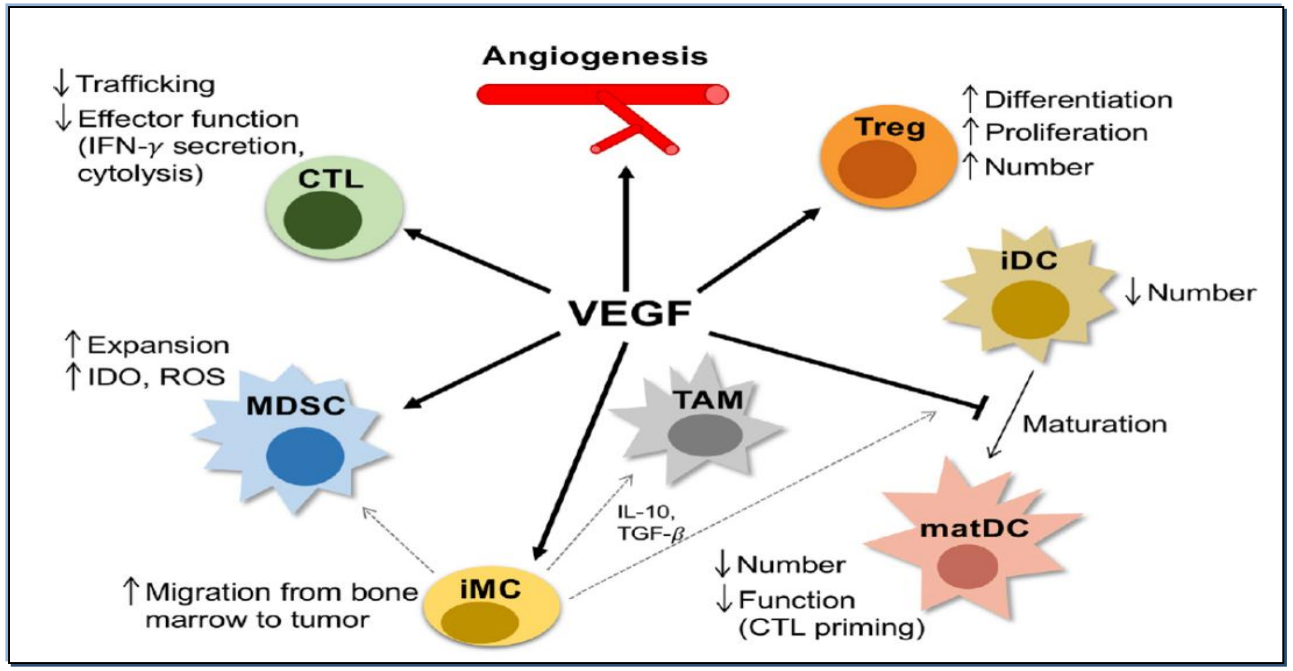
Copy number alterations associated with low immune gene expression

Amplification associated with immune ignorance: VEGFA, ERB-B2

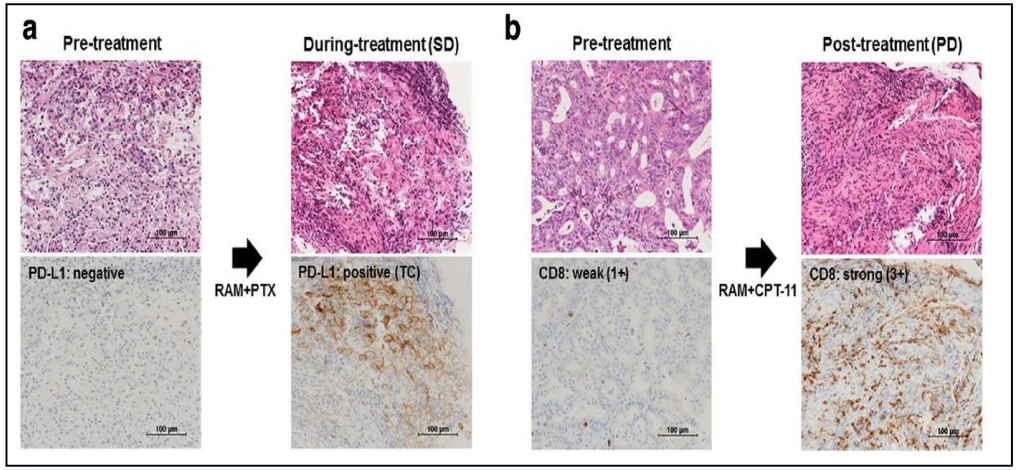
Can we turn cold tumors into hot tumors?
Anti-PD1 and anti-angiogenic inhibitors

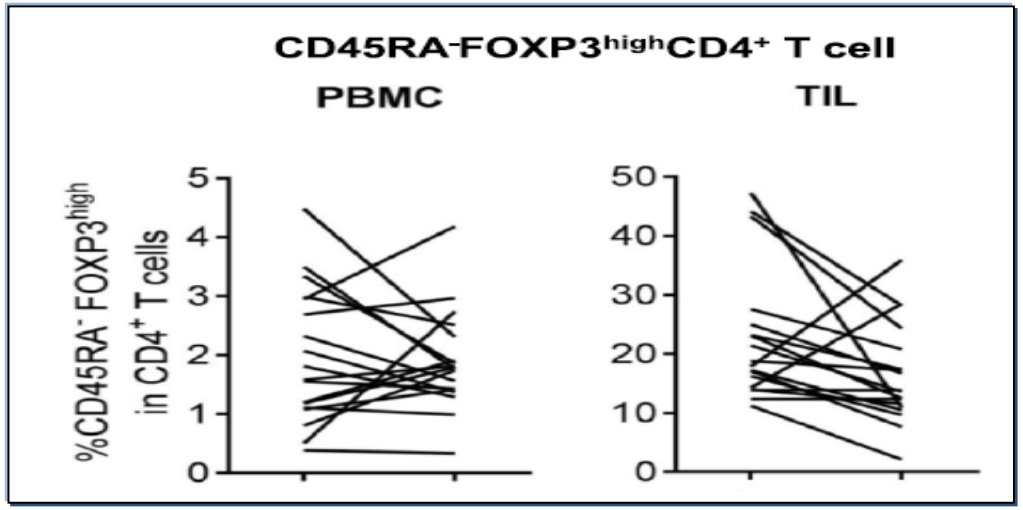


The role of VEGFA in immune suppression



Ramucirumab induces CD8+ T-cell infiltration and decreases Treg cells

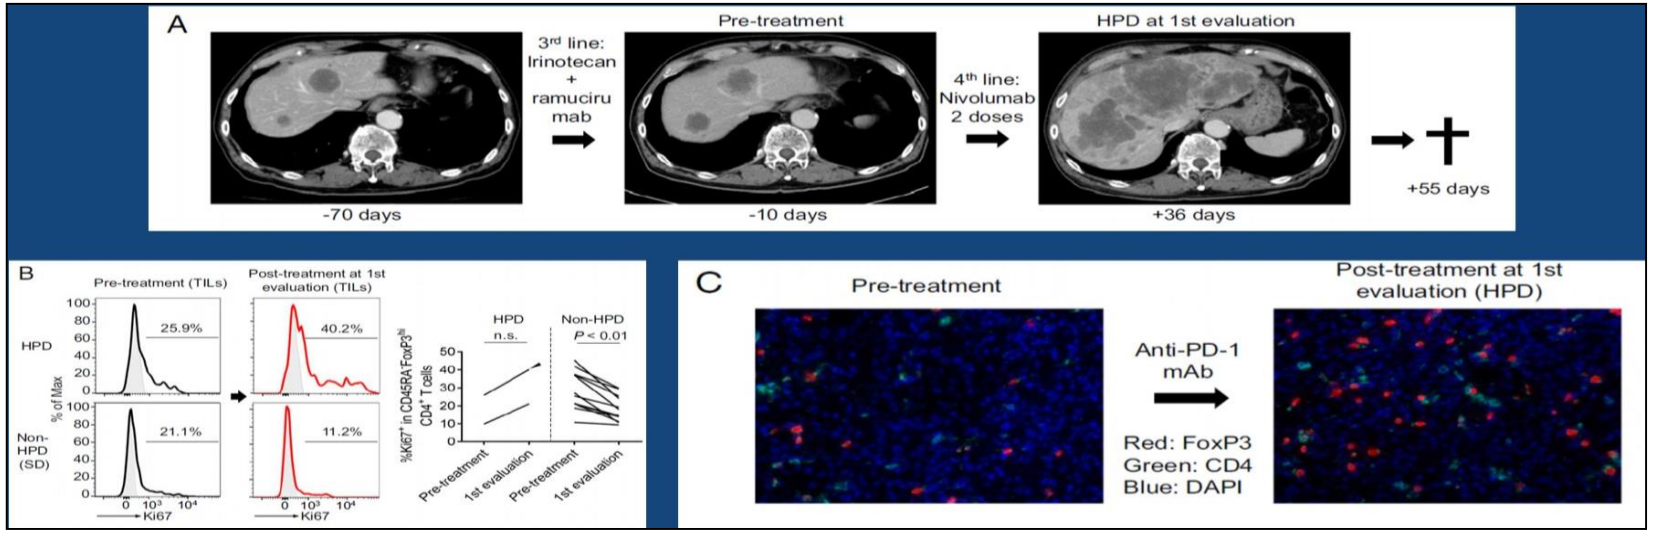


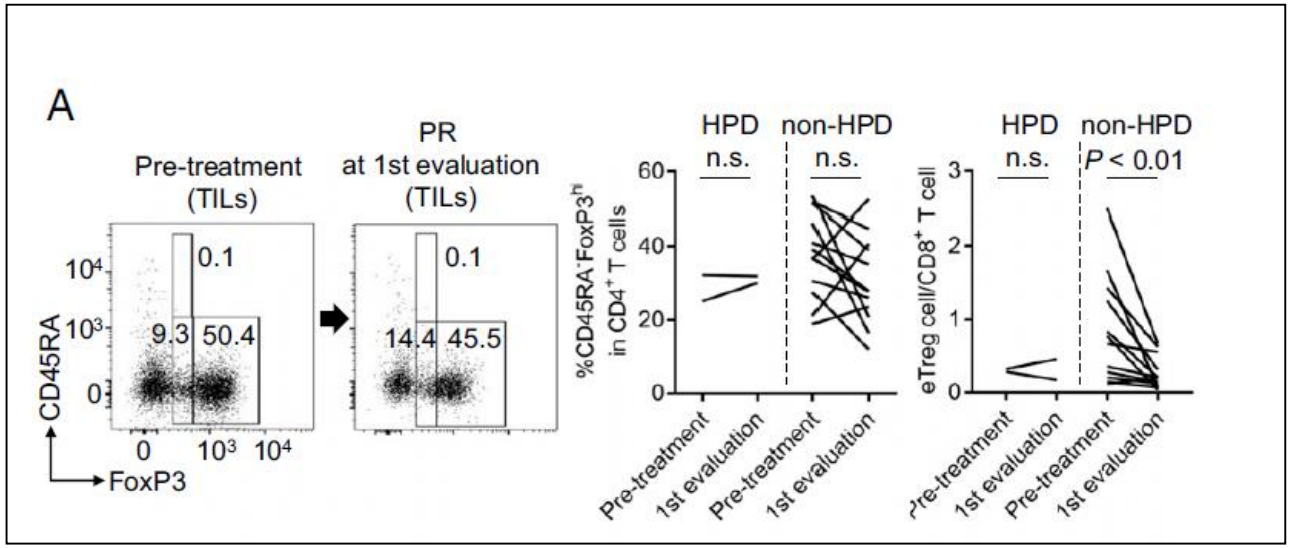


Datta M, ASCO 2019; Tada T, J Immunother Cancer 2018

Can we turn cold tumors into hot tumors?
Anti-PD1 and anti-angiogenic inhibitors

PD-1 blockade may facilitate the proliferation of highly suppressive PD-1+ eTreg cells in HPDs





Kamada T, PNAS 2019

Can we turn cold tumors into hot tumors?
Anti-PD1 and anti-angiogenic inhibitors

Regorafenib plus nivolumab in patients with advanced gastric (GC) or colorectal cancer (CRC): an open-label, dose-finding, and dose-expansion phase 1b trial (REGONIVO, EPOC1603)
