- Changes in everyday activities
- Head and neck problems
- Poor muscle tone in neck
- Bradykinesia, facial
- Problems getting dressed
- Problems with bathing
- Problems carrying out personal grooming
- Urinary incontinence
- Toileting problems
- Bulk difficulties
- Rectal problems
- Gastrointestinal problems
- Problems cooking
- Sucking problems
- Problems going out alone
- Impaired mobility
- Musculoskeletal problems
- Bradykinesia of the limbs
- Poor muscle tone in limbs
- Poor limb coordination
- Poor coordination, trunk
- Poor standing posture
- Irregular gait pattern
- Falls
- Mood problems
- Feeling sad, blue, depressed
- History of depressed mood
- Tiredness all the time
- Depression (clinical impression)
- Sleep changes
- Restlessness
- Memory changes
- Short-term memory impairment
- Long-term memory impairment
- Changes in general mental functioning
- Onset of cognitive symptoms
- Clouding or delirium
- Paranoid features
- History relevant to cognitive impairment or loss
- Family history relevant to cognitive impairment or loss
- Impaired vibration
- Tremor at rest
- Postural tremor
- Intention tremor
- History of Parkinson's disease
- Family history of degenerative disease
- Seizures, partial complex
- Seizures, generalized
- Syncope or blackouts
- Headache
- Cerebrovascular problems
- History of stroke
- History of diabetes mellitus
- Arterial hypertension
- Peripheral pulses
- Cardiac problems
- Myocardial infarction
- Arrhythmia
- Congestive heart failure
- Lung problems
- Respiratory problems
- History of thyroid disease
- Thyroid problems
- Skin problems
- Malignant disease
- Breast problems
- Abdominal problems
- Presence of snout reflex
- Presence of the palmomental reflex
- Other medical history

SCORE PROGNOSTICO di mortalità ad 1 anno

Table 1. MPI Score Assigned to Each Domain Based on the Severity of the Problems

	Problems

Frailty in Older Adults: Evidence for a Phenotype

Linda P. Fried,[1] Catherine M. Tangen,[2] Jeremy Walston,[1] Anne B. Newman,[3] Calvin Hirsch,[4] John Gottdiener,[5] Teresa Seeman,[6] Russell Tracy,[7] Willem J. Kop,[8] Gregory Burke,[9] and Mary Ann McBurnie[2] for the Cardiovascular Health Study Collaborative Research Group

Increasingly, geriatricians define frailty as a biologic syndrome of decreased reserve and resistance to stressors, resulting from cumulative declines across multiple physiologic systems, and causing vulnerability to adverse outcomes (9–13). This concept distinguishes frailty from disability (9,10,14,15). There is a growing consensus that markers of frailty include age-associated declines in lean body mass, strength, endurance, balance, walking performance, and low activity (9,10,14–17), and that multiple components must be present clinically to constitute frailty

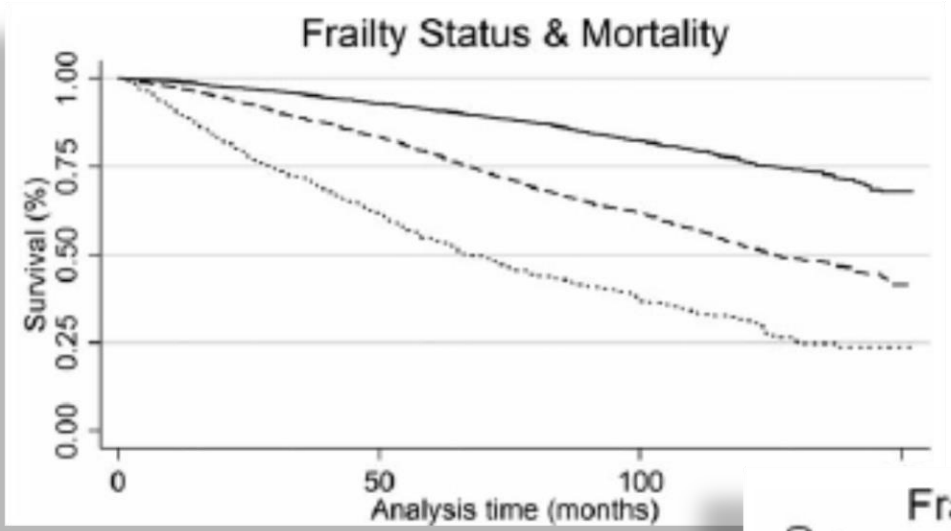
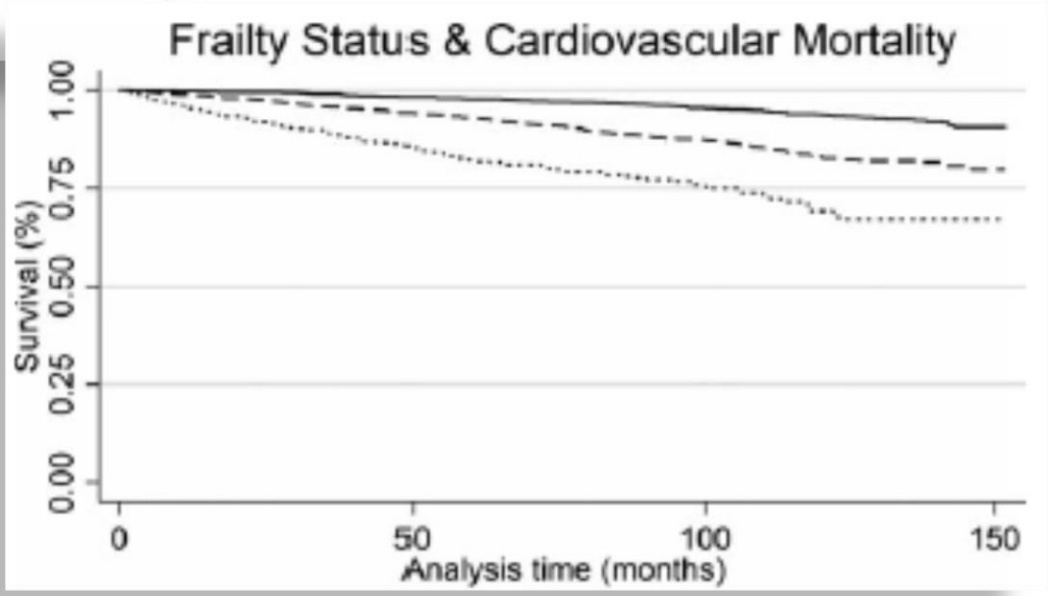
Mortality Risk Along the Frailty Spectrum: Data from the National Health and Nutrition Examination Survey 1999 to 2004

J Am Geriatr Soc 2018.



CONCLUSION: Frailty and prefrailty are associated with increased risk of death. Demonstrating the association between prefrail status and mortality is the first step to identifying potential targets of intervention in future studies.



Mortality Risk Along the Frailty Spectrum: Data from the National Health and Nutrition Examination Survey 1999 to 2004

J Am Geriatr Soc 2018.

Table 3. Association Between Frailty and Overall and Cardiovascular Mortality

	Model 1	Model 2	Model 3
Mortality	Hazard Ratio (95% Confidence Interval)		
Overall			
Prefrail	2.40 (2.16–2.67)	1.79 (1.60–2.01)	1.64 (1.45–1.85)
Frail	4.97 (4.34–5.69)	3.89 (3.36–4.51)	2.79 (2.35–3.30)
Cardiovascular			
Prefrail	2.82 (2.28–3.48)	2.07 (1.65–2.60)	1.84 (1.45–2.34)
Frail	3.72 (2.85–4.87)	4.79 (3.61–6.34)	3.39 (2.45–4.70)

E’ possibile che almeno parte di questo eccesso di mortalità CV e totale nei soggetti FRAGILI possa essere addebitato al mancato uso degli anticoagulanti orali per la FA (o di altri farmaci indicati per il trattamento o la prevenzione della malattie CV) in ragione della loro «fragilità»?

THE AMERICAN JOURNAL of MEDICINE®

Risk of Falls and Major Bleeds in Patients on Oral Anticoagulation Therapy

The American Journal of Medicine (2012) 125, 773-778

Studio prospettico su 515 pazienti dimessi in TAO; 308 pazienti (59.8%) ad alto rischio di cadute; outcome: tempo al primo sanguinamento maggiore; follow-up: 12 mesi

Rischio di sanguinamento maggiore non significativamente aumentato nei pazienti ad alto rischio di cadute rispetto agli altri (8,0 vs 6,8/100/anno, p=.64). Il rischio di sanguinamento maggiore è risultato indipendentemente associato al sesso femminile ed alla politerapia ma non all'alto rischio di cadute. Solo 3 sanguinamenti maggiori conseguenza diretta di caduta (0.6/100/anno)

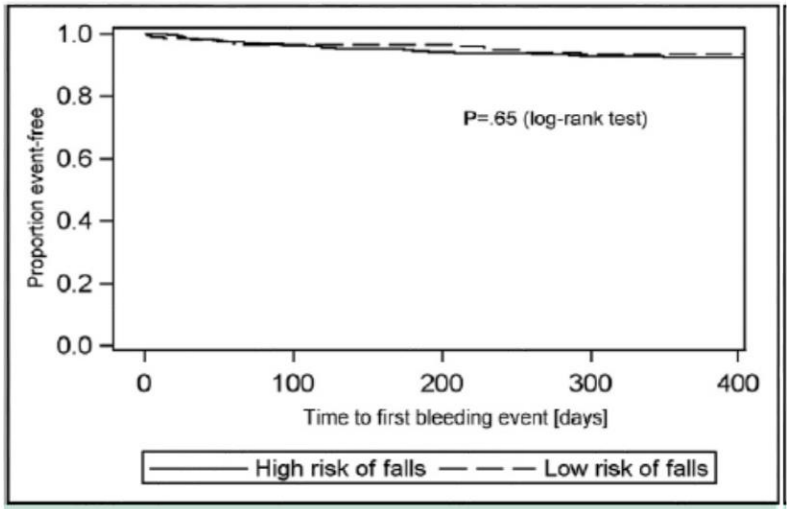

Figure Unadjusted time to first major bleeding event curves according to risk of falls (n = 515).

- The incidence rate of major bleeding in patients on oral anticoagulants is low overall, and fall-related bleeds are rare in these patients.
- A high falls risk is not statistically significantly associated with a risk of major bleeds (hazard ratio 1.09; 95% confidence interval, 0.54-2.21), suggesting that being at risk of falls is not a valid reason to avoid oral anticoagulants in medical patients.

The American Journal of Medicine (2005) 118, 612–617

THE AMERICAN JOURNAL of MEDICINE®

Incidence of intracranial hemorrhage in patients with atrial fibrillation who are prone to fall

METHODS: Quality improvement organizations identified 1245 Medicare beneficiaries who were documented in the medical record to be at high risk of falls and 18 261 other patients with atrial fibrillation. The patients were elderly (mean 80 years), and 48% were prescribed warfarin at hospital discharge. The primary endpoint was subsequent hospitalization for an intracranial hemorrhage, based on ICD-9 codes.

Table 3 Multivariate Cox regression showing hazard ratios (HR) of independent predictors of intracranial hemorrhage

Factor	HR (95% CI)	*P* Value
High-risk for falls	1.9 (1.3–2.9)	0.002
Prior stroke	2.2 (1.7–2.8)	<0.0001
Prior bleed	1.8 (1.4–2.4)	<0.0001
Neuropsychiatric impairment	1.4 (1.0–1.9)	0.055

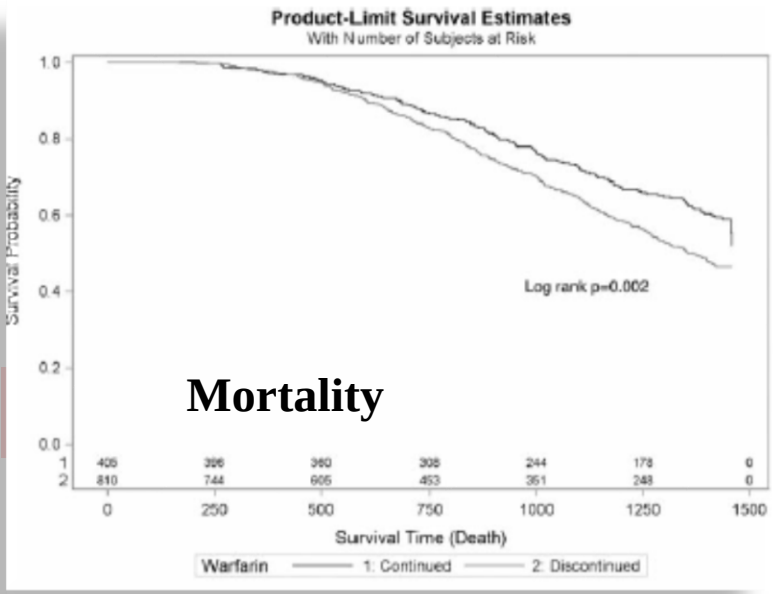
Table 4 Hazard ratio of warfarin for composite outcome—out-of-hospital death or hospitalization for stroke, myocardial infarction, or hemorrhage—in 1245 patients at high risk for falls

$CHADS_2$ score	Hazard ratio (95% CI)	*P* value	Recommended antithrombotic therapy
0–1	0.98 (0.56,1.72)	0.94	Aspirin or nil
2–6	0.75 (0.61,0.91)	0.004	Anticoagulant

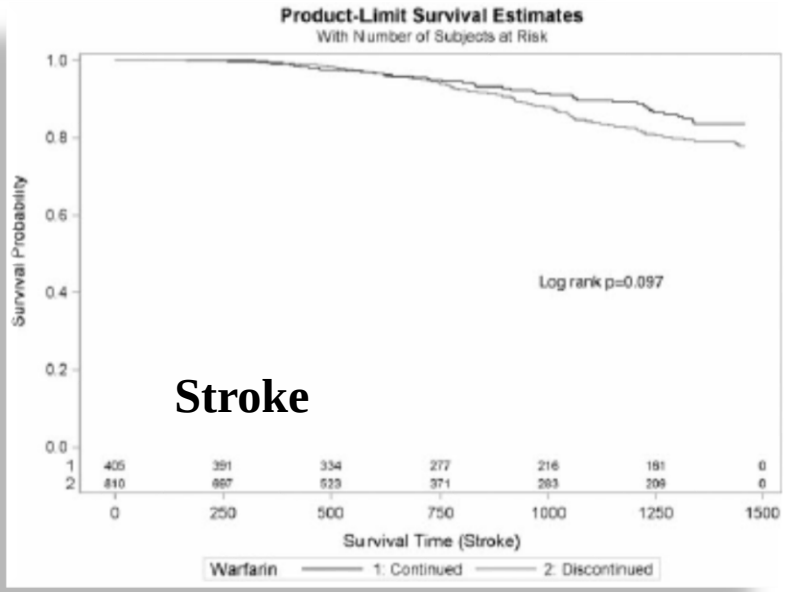
CONCLUSION: Patients at high risk for falls with atrial fibrillation are at substantially increased risk of intracranial hemorrhage, especially traumatic intracranial hemorrhage. However, because of their high stroke rate, they appear to benefit from anticoagulant therapy if they have multiple stroke risk factors.

Continued Use of Warfarin in Veterans with Atrial Fibrillation After Dementia Diagnosis

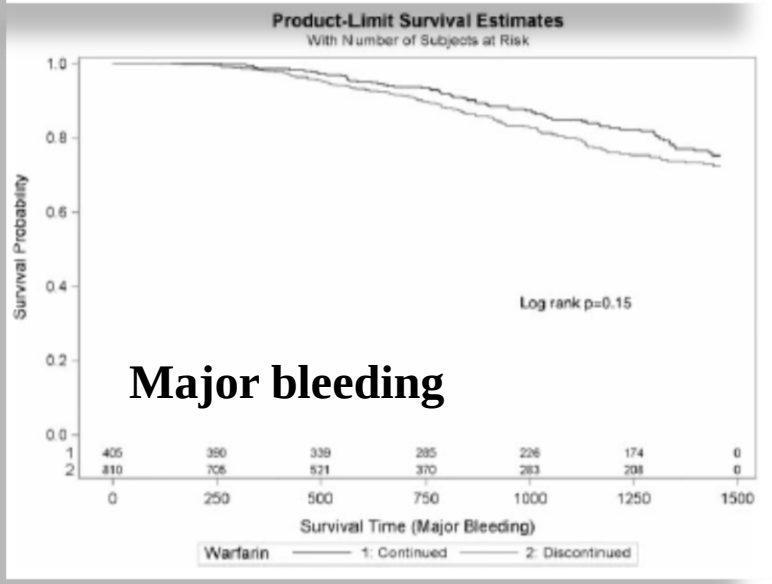
J Am Geriatr Soc 65:249–256, 2017.



Mortality



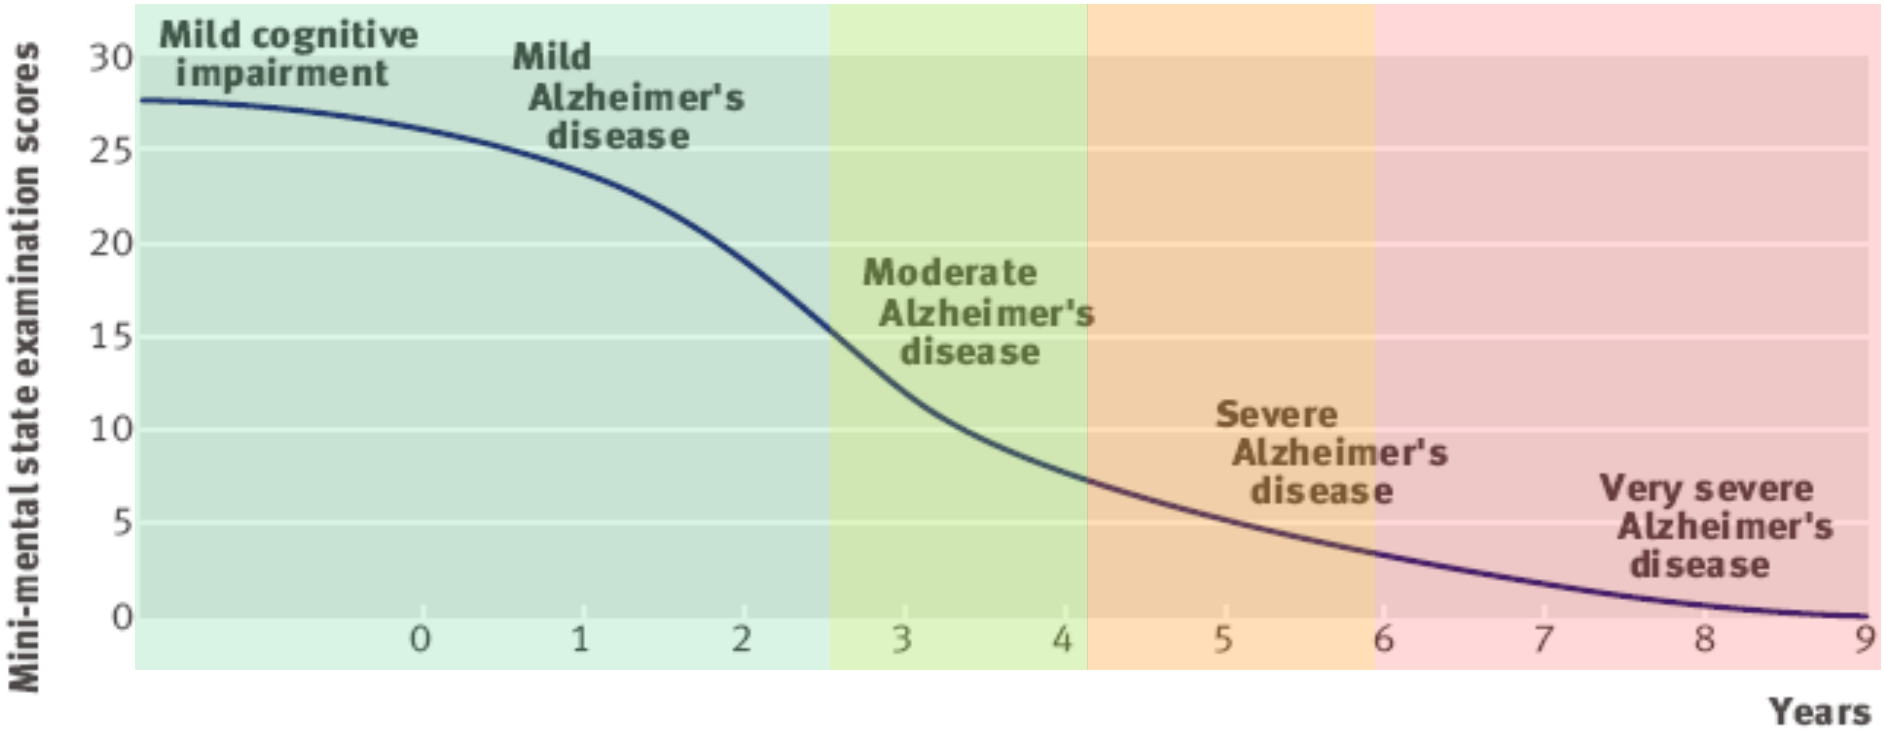
Stroke



Major bleeding

Using propensity score matching, the protective effect of continuing warfarin persisted in prevention of stroke (HR = 0.74, 95% CI = 0.54–0.996, $P = .047$) and mortality (HR = 0.72, 95% CI = 0.60–0.87, $P < .001$), with no statistically significant decrease in risk of major bleeding (HR = 0.78, 95% CI = 0.61–1.01, $P = .06$).

CONCLUSION: Discontinuing warfarin after a diagnosis of dementia is associated with a significant increase in stroke and mortality. **J Am Geriatr Soc 65:249–256, 2017.**



Mild cognitive impairment: Complaints of memory loss, intact activities of daily living, no evidence of Alzheimer's disease

Mild Alzheimer's disease: Forgetfulness, short term memory loss, repetitive questions, hobbies, interests lost, impaired activities of daily living

Moderate Alzheimer's disease: Progression of cognitive deficits, dysexecutive syndrome, further impaired activities of daily living, transitions in care, emergence of behavioural and psychological symptoms of dementia

Severe Alzheimer's disease: Agitation, altered sleep patterns, assistance required in dressing, feeding, bathing, established behavioural and psychological symptoms of dementia

Very severe Alzheimer's disease: Bedbound, no speech, incontinent, basic psychomotor skills lost

Obiettivo: *quantificare* ***il beneficio clinico netto del warfarin*** *in 13559 pazienti con FA (****6141 età>75 anni****; 45% femmine); studio misto retrospettico e prospettico su pazienti consecutivi con FA dal 1996 al 2003*

Benefit minus harm (net treatment benefit) was highest in patients with:
-previous stroke
-age older than 84 years
-others with high stroke risk

Age and Ageing 2018; **47:** 9–17

Effectiveness and safety of oral anticoagulants in older patients with atrial fibrillation: a systematic review and meta-regression analysis

Key points

- Warfarin use was superior to warfarin non-use, aspirin and no antithrombotic therapy in reducing the risk of stroke/TE in older patients with AF.
- The non-vitamin K antagonist oral anticoagulants (NOACs) were superior to warfarin for stroke/TE prevention with reduced risk of major bleeding in older AF patients.
- This study adds to the evidence suggesting that NOACs should be preferred to warfarin as oral anticoagulants for stroke prevention in older people with AF.

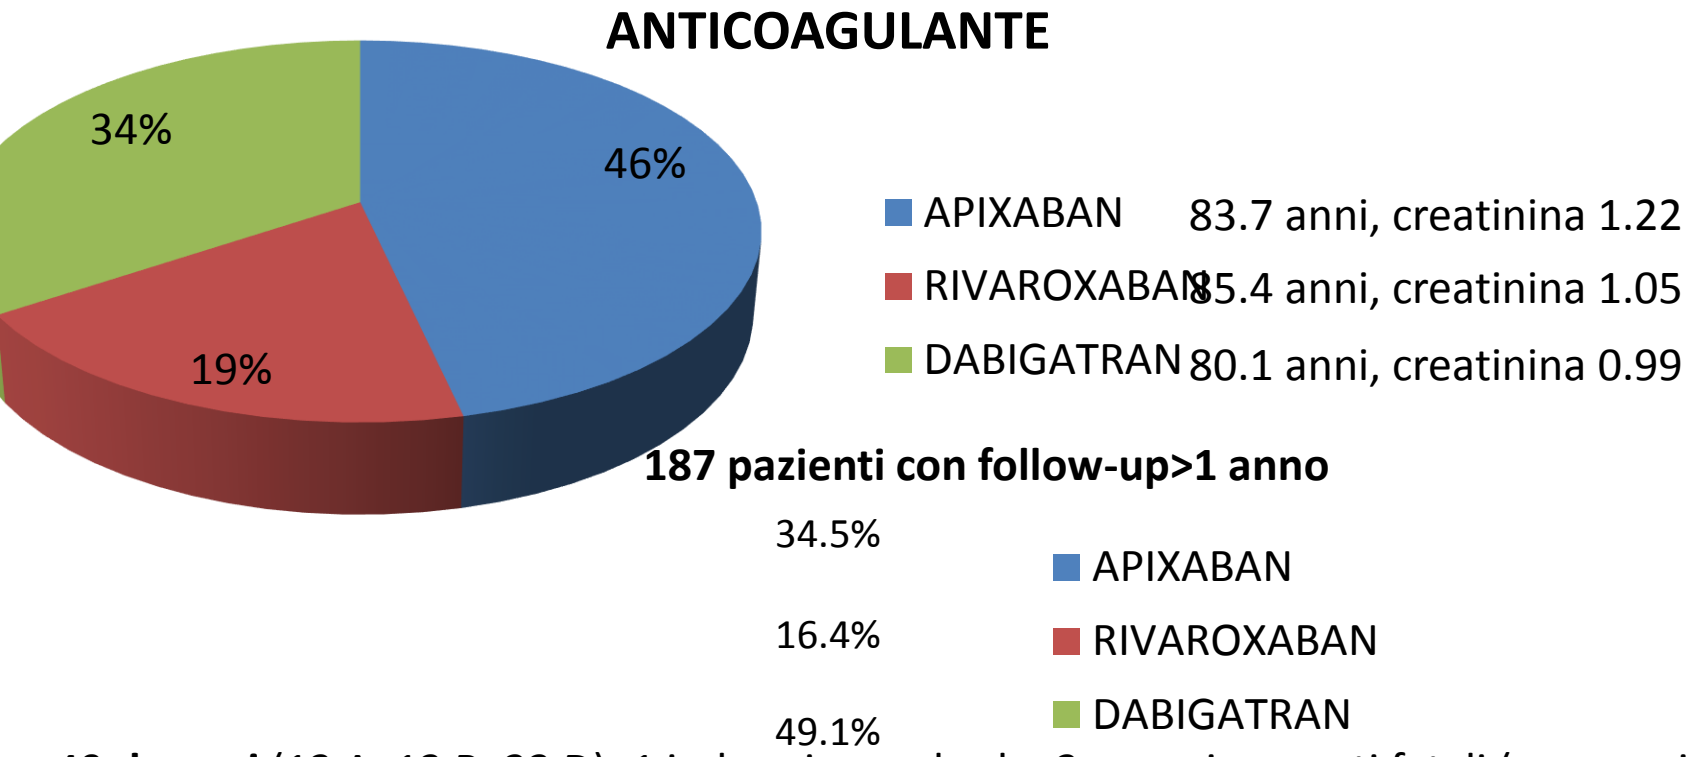
Antithrombotic treatment in elderly patients with atrial fibrillation: a practical approach

CONTRAINDICATIONS

Comorbidities or frailty do not contraindicate anticoagulation…life expectancy, functionality and cognitive impairment should be considered… **Age, risk of falls, previous bleedings** (particularly when the cause has been eliminated), **need for antiplatelet treatment should not be considered contraindications to anticoagulation**

Quindi, sebbene la TAO sia tradizionalmente vista come una terapia "impegnativa" per l'anziano polipatologico, non vi è evidenza di dover arbitrariamente negare questa opzione in assenza di controindicazioni o comorbilità associate ad una cattiva prognosi a breve e, soprattutto, in presenza di una conservata autonomia funzionale.

372 pazienti dimessi con NAO (F 56%, 82.8 anni), CHA2DS2-VASC 4.5 (1.4), HAS-BLED 1.9 (0.8)



187 pazienti con follow-up>1 anno

49 **decessi** (13 A, 13 R, 23 D): 1 ischemia cerebrale, 3 sanguinamenti fatali (emorragie da perforazione intestinale), 7 neoplasie, 6 CAD, 7 HF, 11 cause infettive, 15 demenza & marasmi

8 **sanguinamenti maggiori** non fatali prevalentemente gastrointestinali (3 in concomitante uso di FANS, 3 in presenza di peggioramento funzionalità renale)

297 pazienti ambulatoriali con NAO (F 51%, 80.1 anni), CHA2DS2-VASC 4.3 (1.2), HAS-BLED 1.7 (0.8) con follow-up >1 anno: 35 **decessi** (nessuno riconducibile a NAO), 7 **sanguinamenti maggiori non fatali**

Età avanzata/pazienti fragili

- Il trattamento anticoagulante nei pazienti anziani è sottoutilizzato? Se sì, quali le principali motivazioni?
- Le sotto analisi degli studi di fase III confermano la sicurezza e l'efficacia dei NOAC nel paziente anziano? I dati di real world sono discordanti dai trial clinici?
- Quali i dati nel grande anziano (≥85 aa)?
- Esistono dati sufficienti nei pazienti a rischio di caduta? Come identificarli?
- Esistono differenze tra i NOAC?

Età avanzata/pazienti fragili

A global clinical measure of fitness and frailty in elderly people

CMAJ 2005;173(5):489-95

Kenneth Rockwood, Xiaowei Song, Chris MacKnight, Howard Bergman, David B. Hogan, Ian McDowell, Arnold Mitnitski

Box 1: The CSHA Clinical Frailty Scale

1 *Very fit* — robust, active, energetic, well motivated and fit; these people commonly exercise regularly and are in the most fit group for their age

2 *Well* — without active disease, but less fit than people in category 1

3 *Well, with treated comorbid disease* — disease symptoms are well controlled compared with those in category 4

4 *Apparently vulnerable* — although not frankly dependent, these people commonly complain of being "slowed up" or have disease symptoms

5 *Mildly frail* — with limited dependence on others for instrumental activities of daily living

6 *Moderately frail* — help is needed with both instrumental and non-instrumental activities of daily living

7 *Severely frail* — completely dependent on others for the activities of daily living, or terminally ill

Note: CSHA = Canadian Study of Health and Aging.

Table 3: Receiver operating characteristic (ROC) analyses for adverse outcomes within 70 months

	Area under the ROC curve

Clinical Outcomes and History of Fall in Patients with Atrial Fibrillation Treated with Oral Anticoagulation: Insights From the ARISTOTLE Trial

THE AMERICAN JOURNAL of MEDICINE®

PURPOSE: We assessed outcomes among anticoagulated patients with atrial fibrillation and a history of falling, and whether the benefits of apixaban vs warfarin are consistent in this population.

METHODS: Of the 18,201 patients in the Apixaban for Reduction in Stroke and Other Thromboembolic Events in Atrial Fibrillation (ARISTOTLE) study, 16,491 had information about history of falling–753 with history of falling and 15,738 without history of falling. The primary efficacy outcome was stroke or systemic embolism; the primary safety outcome was major bleeding.

RESULTS: When compared with patients without a history of falling, patients with a history of falling were older, more likely to be female and to have dementia, cerebrovascular disease, depression, diabetes, heart failure, osteoporosis, fractures, and higher CHA_2DS_2-VASc (Congestive heart failure, Hypertension, Age ≥75 years, Diabetes mellitus, prior Stroke or TIA or thromboembolism, Vascular disease, Age 65-74 years, Sex category female) and HAS-BLED (Hypertension, Abnormal renal and liver function, Stroke, Bleeding, Labile international normalized ratio, Elderly, Drugs or alcohol) scores. Patients with a history of falling had higher rates of major bleeding (adjusted hazard ratio [HR] 1.39; 95% confidence interval [CI], 1.05-1.84; $P = .020$), including intracranial bleeding (adjusted HR 1.87; 95% CI, 1.02-3.43; $P = .044$) and death (adjusted HR 1.70; 95% CI, 1.36-2.14; $P < .0001$), but similar rates of stroke or systemic embolism and hemorrhagic stroke. There was no evidence of a differential effect of apixaban compared with warfarin on any outcome, regardless of history of falling. Among those with a history of falling, subdural bleeding occurred in 5 of 367 patients treated with warfarin and 0 of 386 treated with apixaban.

CONCLUSIONS: Patients with atrial fibrillation and a history of falling receiving anticoagulation have a higher risk of major bleeding, including intracranial, and death. The efficacy and safety of apixaban compared with warfarin were consistent, irrespective of history of falling.

Characteristics	Fall(s) Within 1 Year		*P*-Value

Apixaban Better
Warfarin Better

CONCLUSION

Patients with atrial fibrillation and a history of falling who are treated with anticoagulation have a higher risk of major bleeding, including intracranial bleeding, major or clinically relevant nonmajor bleeding, cardiovascular death, and all-cause death. The efficacy and safety benefits of apixaban compared with warfarin were consistent, irrespective of history of falling.

CLINICAL SIGNIFICANCE

- Patients with atrial fibrillation and a history of falling receiving anticoagulation had a higher risk of major bleeding, including intracranial bleeding, and death, but similar rates of stroke or systemic embolism and hemorrhagic stroke.
- Benefits of apixaban over warfarin were preserved, with an 80% reduction in intracranial bleeding; thus, apixaban appears to be a better alternative than warfarin for anticoagulation in patients with a history of falling.

VALUTAZIONE ORIENTATA ALLA PERFORMANCE DEI PROBLEMI DI MOBILITA': TINETTI	
Scala CONLEY	
Cut off point	Esperienza e giudizio clinico. >18 (versione breve) è indicato come cut off point predittore di cadute (Tinetti 1986)
Conclusioni	Vengono valutati molti aspetti sia dell'equilibrio che della performance. Lunga da somministrare e gravosa per i pazienti.

SCALA CONLEY

ISTRUZIONI: le prime tre domande devono essere rivolte solo al paziente. Possono essere rivolte ad un familiare o al caregiver o all'infermiere solo se il paziente ha gravi deficit cognitivi e fisici che gli impediscono di rispondere. Barrare il valore corrispondente alla risposta fornita, Sommare i valori positivi. La risposta "Non so" è da considerare come risposta negativa.

Precedenti cadute (domande al paziente/caregiver/infermiere)	SI	NO
C1 - E' caduto nel corso degli ultimi tre mesi?	2	0
C2 - Ha mai avuto vertigini o capogiri? (negli ultimi 3 mesi)	1	0
C3 - Le è mai capitato di perdere urine o feci mentre si recava in bagno? (negli ultimi 3 mesi)	1	0
Deterioramento cognitivo (osservazione infermieristica)		
C4 - Compromissione della marcia, passo strisciante, ampia base d'appoggio, marcia instabile.	1	0
C5 - Agitato (Definizione: eccessiva attività motoria, solitamente non finalizzata ed associato ad agitazione interiore. Es: incapacità a stare seduto fermo, si muove con irrequietezza, si tira i vestiti, ecc.).	2	0
C6 - Deterioramento della capacità di giudizio / mancanza del senso del pericolo.	3	0

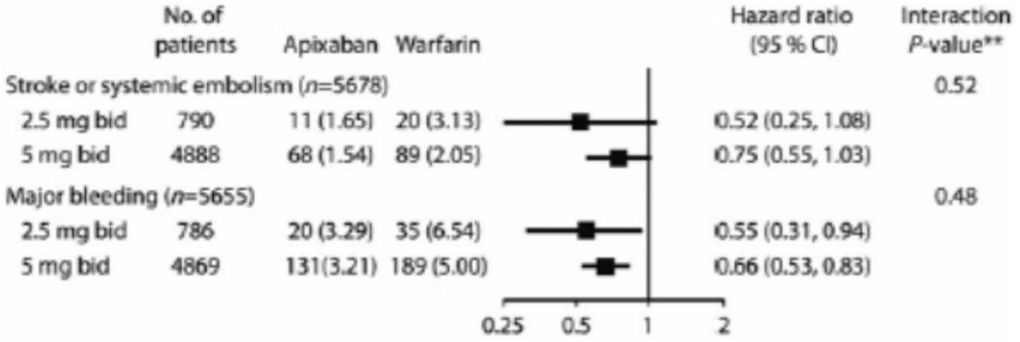
2016 ESC Guidelines for the management of atrial fibrillation developed in collaboration with EACTS

Health status, geriatric syndromes and prescription of oral anticoagulant therapy in elderly medical in-patients with atrial fibrillation: a prospective observational study

International Journal of Cardiology 187 (2015) 123–125

M. Bo [a], F. Li Puma [a], M. Badinella Martini [a], Y. Falcone [a,*], M. Iacovino [a], E. Grisoglio [a], M. Bonetto [a], G. Isaia [b], G. Ciccone [a], G.C. Isaia [a], F. Gaita [c]

Advanced age, very short life expectancy, difficult or impossible management of therapy, perceived fear of bleeding and harm greater than benefit were the most common reasons why physicians withhold OAs.



A reduced dose of 2.5 mg twice daily or placebo were administered to a total of 831 patients; 790 of these patients were ≥75 years.
** Interaction among treatment, age and dose based on randomized or treated population

Choosing a particular oral anticoagulant and dose for stroke prevention in individual patients with non-valvular atrial fibrillation: part 2

Non-vitamin K oral anticoagulants and age

First choice	In patients older than 75 years, we suggest apixaban 5 mg twice daily [2.5 mg if ≥2 of the following: age ≥80 years, body weight ≤60 kg, or creatinine ≥1.5 mg/dL (133 μmol/L)]
Second choice	Dabigatran 110 mg twice daily, rivaroxaban 20 mg once daily, or edoxaban 60 mg once daily

Sebbene la TAO sia tradizionalmente vista come una terapia "impegnativa" per l'anziano polipatologico, non vi sono evidenze che ne scoraggino l'uso in ragione dell'età avanzata, in assenza di controindicazioni o comorbilità associate ad una cattiva prognosi a breve. Vi sono discrete evidenze che i DOACs, ed in particolare Apixaban, possano essere una valida alternativa al warfarin in questi pazienti

& ADRs

Maggior prevalenza di FAC rispetto a FAP
Maggior rimodellamento atriale
Minor efficacia terapia antiaritmica
Maggior prevalenza e severità cardiopatia
